

Mean Green Hand Scrub-Auto Mechanics Number One Choice For Hand Cleaner. Get a Free Sample Now.

It uses a unique complex that reaches out and envelops the dirt microscopically and binds it into the formula and when you rinse your hands at the sink....it will even clean the sink.

MEAN GREEN Power Hand Scrub is what made us Famous! It is unlike any Hand Cleaner you have ever seen in your whole life. It's not waterless, it works with water, it works under an entirely different principle of cleansing skin. It has no solvents and no caustic chemicals like other hand cleaners. It uses a unique complex that reaches out and envelops the dirt microscopically and binds it into the formula and when you rinse your hands at the sink....it will even clean the sink.

It will take off anything!

No qualification here. We have simply been unable to find anything the working person gets his hands into that MEAN GREEN Hand Scrub can't remove. Tar, asphalt, grease, oil, bondo, glue, adhesives, paint (wet or dry), printers ink (this is what it was invented for), etc... This makes it sound like it is a really harsh industrial hand cleaner loaded with solvents --- NOT SO!

MEAN GREEN will actually help your hands heal!

MEAN GREEN Hand Scrub exactly how you see it, is presently being sold to cosmetic companies in bulk to be repackaged into fancy little bottles and then sold by fashion boutiques as a Ladies Face Scrub! There are absolutely NO petroleum solvents of any kind in the formula. Don't be fooled by other hand cleaner companies that claim "petroleum solvent free". All they do is substitute harsh D'Limonene (turpentine made from orange peels) or "mineral spirits" or some other harsh solvents which are terrible for your hands.

It is the cheapest hand cleaner you will ever love!

MEAN GREEN Hand Scrub is so concentrated, you will get 300 hand washes per pound! That works out to about 2 cents per wash. SAVE up to 58% compared to waterless. GoJo, DL, Loyal and all "other WATERLESS" hand cleaners cost you from 8 to 12 cents per wash. Whoa, you say, won't I waste MEAN GREEN Hand Scrub? Simple, MEAN GREEN is so concentrated that if you try to use too much, you will spend quite a while trying to get it off your hands, thus defeating the purpose of waste. MEAN GREEN Hand Scrub is the only self regulating hand cleaner on the market!

Please contact me for more information or how you can get a FREE SAMPLE of this amazing Hand Cleaner.

Testimonial:

"Steve,

Thank you for your help with Mean Green hand cleaner. My technicians are very pleased with the performance of the cleaner and how easy it is on their hands since they scrub their hands on the average of 10 times per day. The fact that Mean Green does not have any solvents is the best reason to use this cleaner since it does not have any proven long term effects.

I feel confident that Mean Green is the best hand cleaner for my shop and the health of my technicians.

Thanks again Steve!

Sincerely,

Eric Lang

Recently, Eric ran out of his hand cleaner and we stopped by to take him a small tub to tide him over until his new shipment arrived. He said that he had pulled out some of the old stash of Gojo and his guys lined up in front of his desk wanting to know if they were going back to that 'stuff'....it was their contention that nothing works like Mean Green Tough Hand Cleaner nor is as gentle! No way do they want to go back. He was very grateful for the tub we brought by.

....Others, "One of our mechanics left and took our tub of Mean Green Tough Hand Cleaner with him, we need to re-order now!"

...."I'm at a new shop and they are using that orange stuff, can you stop by, I want to get them started using Mean Green Tough Hand Cleaner."

...."The owners took the Mean Green Tough Hand Cleaner to their new shop, could you bring us samples while we wait for our order"..

..."As an independent plumber, I never felt my hands were clean. This hand cleaner truly makes them feel clean, and my wife is happy. With a little nail scrubber and some Mean Green I can come to the dinner table without worrying."

It is without a doubt the best hand cleaner ever!

Mean Green Power Hand Scrub Biocompatibility Statement Jan 1, 1984

Mean Green Power Hand Scrub is a chemical formula which can be considered as of negligible toxicity.

It contains

1. no caustic or alkaline ingredients,
2. no solvents,
3. no acids

It has a delicate Ph of just past neutrality at 7.4 to 7.6. It is compounded with mild, biologically harmonious ingredients in a combination that is considered compatible with human body systems. However, as safe as it is, it is not advisable to eat it, get it in the eyes. Treat it in the same fashion as an adult hair shampoo. It is very difficult to swallow any of it because it produces a gag reaction. But, even if it were ingested, the most harm would be a little diarrhea because the detergent action would destroy non-pathogenic bacteria present in the intestines.

Concerning compatibility as a part of naturally occurring ecological systems, Mean Green Power Hand Scrub has been designed to be chemically sympathetic with the balance of life structures and chemical materials found in such natural environments as rivers, lakes and streams.

The cleaning emollient portions of Mean Green Power Hand Scrub is made up of anionic and nonionic surfactants. Further, it contains no phosphates, but biologically disassociating chemicals that are classified as completely biodegradable.

The abradant is not biodegradable, but it is not considered a pollutant. This plastic material, used as a scrubbing agent, is polyethylene in granule form. Polyethylene has been tested and accepted by the pharmaceutical industry for use in facial cleansing preparations designed as adjunctive treatments for acne conditions. The logic behind their choice, as ours, is based on the phenomenon that this material is a straight chain polymer. That is to say there are no side chains or radicals attached:

In fact, it has no other elements of any kind, other than pure carbon and hydrogen. This means it will not break down into something harmful or split off anything that would be toxic. On the other hand, plastics such as vinyl, polyurethane, or even rubber have chlorine and other radicals which split off when exposed to heat or merely exposure to the environment.

Mean Green, Ltd. and companies like Listerine, Westwood Labs and other pharmaceutical houses have selected polyethylene because when it is washed down drains and into the sewage system and into rivers and streams, it will not fractionate into damaging toxins or agents dangerous to those ecological systems.

The granules described above are of a controlled particle size. The individual particles are held to less than 25 micron average diameter, with all of them less than 34 microns. This is smaller than many airborne dust and sand particles that are a continuing part of our natural environment.

Since the granules in Mean Green Power Hand Scrub, as well as those of many pharmaceutical preparations, do not fractionate or disassociate or dissolve but are of a stable compound, they in a very real sense are synonymous in their ecological role as the sand or dirt that would be on skin or clothing that is washed and then goes down the drain

The comparison is even more valid when one considers that sand, SiO₂(silicon dioxide), is also not biodegradable. It is also washed down the drain and into the water system. It, of course is also stable and merely becomes a part of the sand bank of the rivers, streams and oceans. The granules of Mean Green function entirely and exactly through their cycle in the same manner as the tiny sand or dirt particles and come to rest at last in the same place, doing the same thing

Therefore, it can be seen that Mean Green Power Hand Scrub is a biologically harmonious chemical system that has been designed to be totally biocompatible with natural life support ecological systems.
